

Three AI minds. One consensus portfolio.

Quorum is an AI-powered investment committee that brings together Claude, GPT-4o, and Gemini as independent research analysts. Each model screens the market, builds a macro thesis, and nominates picks with conviction — then Quorum synthesizes a consensus portfolio weighted by cross-member agreement. The result: institutional-depth research, on demand, without the headcount.

INDEPENDENT AI PERSPECTIVES

THE CHALLENGE

THE PROBLEM

Serious investors need more than a single AI chatbot or data feed. Research takes hours. Conviction is hard to calibrate. And a single perspective — human or AI — carries blind spots that only surface when it's too late.

THE SOLUTION

Quorum runs three frontier models as independent committee members, each doing its own research with no visibility into what the others are doing. Where they agree, conviction is high. Where they diverge, you see the debate.

WHAT YOU GET

Consensus Portfolio

A treemap of 10–20 core positions plus moonshots, allocation-weighted by cross-member conviction. Unanimous picks get 3× the weight of solo nominations.

Stock Advisor

Type any ticker for a structured buy / watch / pass verdict from each committee member — including investment thesis, analyst targets, and philosophy fit.

Benchmark Performance

Rolling 1-year return vs. SPY, VGT, and VTI. Know exactly how the committee's picks are performing against the indices you care about.

Live Exclusion Controls

Filter any ticker or sector instantly without re-running the committee. Raw picks are preserved — exclusions apply at read time and are fully reversible.

Full Run History

Every session is persisted immutably. Compare any two runs side-by-side to track how conviction has shifted as market conditions evolve.

Parallel Research Engine

All three models research concurrently. A full committee run — macro analysis, universe screening, picks generation — completes in minutes.

POWERED BY

● Claude (Anthropic)

● GPT-4o (OpenAI)

● Gemini (Google)

ALLOCATION MAP

CoreMoonshot3-way = green border

Consensus Portfolio — Allocation Map

Treemap weighted by cross-member conviction. Three-way consensus picks (green border) receive the highest allocation. Moonshots are isolated in a separate band so they never dominate the portfolio structure.

Gemini

Performance — vs. SPY, VGT, VTI

Rolling 1-year cumulative return with summary metric cards. The committee's portfolio returned +43.7% vs. SPY's +29.4% over the same period.

HOW IT WORKS

1

Independent Research

Each model screens the universe and builds a macro thesis — no visibility into what the others are doing.

2

Committee Picks

Each member nominates core positions and moonshots with conviction levels and variant perception theses.

3

Consensus Weighting

Solo picks get 1x. Two-of-three agreement gets 2x. Unanimous conviction gets 3x portfolio weight.

4

Actionable Portfolio

Weights summing to 100%, analyst targets, and recommended dollar allocations — ready to deploy.

WHY QUORUM IS DIFFERENT

Model Diversity by Design

Claude, GPT, and Gemini have different training data and reasoning tendencies. Where they disagree, the debate is signal — not noise.

Philosophy-Aligned

Growth bias, ESG-lite criteria, and configurable sector exclusions. The committee works within your investment mandate from day one.

Bounded Risk Exposure

Moonshots are structurally capped at a lower base weight. High-conviction bets are isolated and never dominate — even at full consensus.
